-I- FUNCTION: HIGH VOLTAGE-ACTIVATED CALCIUM CHANNEL SENSITIVE CALCIUM CHANGEL SENSITIVE CALCIUM CHEGA-CONOTOXIN. MAY MEDIATE THE OMEGA-CONOTOXIN-SENSITIVE CALCIUM INFLUX REQUIRED FOR NEUROTRANSMITTER RELEASE AT MANY SYMAPSES. MAY ALSO PLAY A ROLE IN DIRECTED MIGRATION OF IMMATURE NEURONS.
-I- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-I- TISSUE SPECIFICITY: CENTRAL NERVOUS SYSTEM.
-I- ALTERNATIVE PRODUCTS: TWO FORMS OF ALPHA-1B (ALPHA-1B-1 AND ALPHA-1B-2) ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE. THE SEQUENCE SHOWN HERE IS THAT OF ALPHA-1B-1.
-I- SIMILARITY: TO OTHER CALCIUM CHANNEL ALPHA SUBUNITS.
                                                                                                                                                                                                                                               TRANSMEM TRANSMEM

PR New isolated haemopoietin receptor - used for developing products PT New isolated haemopoietin, differentiation and survival of cells, PT e.g. neuronal cells
PT e.g. neuronal cells
PT e.g. neuronal cells
PS Claim 15; Page 84-87; 182pp; English.

CC Interaction between the novel HR and a ligand facilitates proliferation, CC differentiation and survival of a wide variety of cells. The HR and it's CC derivatives can be used for modulating the activity of the receptors e.g.
CC to regulate development, maintenance or regeneration in an array of CC different cells and tissues in vitro and in vivo. They can be present in CC different cells used for modulating neuronal proliferation; differentiation come conserved in the products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

and survival.
e.g. for cance
Sequence 278
                       claim 17; Page 93-95; 182pp; English.

The protein sequence was generated by a 5N RACE of brain cDNA using NR6 specific primers. NR6 is a novel Haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis,
                                                                                                                                                             for modulating proliferation, e.g. neuronal cells claim 17; Page 93-95; 182pp;

  The present sequence represents a Zcytor5 variant protein. Zcytor5 is a Cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      U4 protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sponse. Transformed mammalian cells are used to produce recombinant protein. The U4 protein is used to screen for specific binding yents, raise antibodies. It is also used as reagents for assays and stissue markers for isolation of cognate ligands and receptors, and pharmaceutical compositions which may modulate cell proliferation, all differentiation, and the immune system (e.g. for treating immune ificiency, inherited or the result of infection, autoimmune diseases,
                                                                                                                                                                                                                                                                                                                                                                                  sapiens.

Claim 1; Page 75-76; 55pp; English.

Chief present sequence represents a protein designated Zcytor5; which a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or KNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a Zcytor5 variant protein. Zcytor5 is a cytokinin like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

or immune response, for treating trunce.

PS Claim 9; Pagees 29-30; 38pp; English.

CC This is the amino acid sequence of the human U4 protein from the CC haematopoletin receptor superfamily, used in the method of the CC invention for the modulation of cell proliferation, or the immune CC response. Transformed mammalian cells are used to produce recombinant CC U4 protein. The U4 protein is used to screen for specific binding CC agents, raise antibodies. It is also used as reagents for assays and CC as tissue markers for isolation of cognate ligands and receptors, and CC cell differentiation, and the immune system (e.g. for treating immune antipolic compositions which may modulate cell proliferation, in the immune system (e.g. for treating immune antipolic contributions of infection, autoimmune diseases,

Zcytor5 is a Cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

Zcytor5 the present sequence represents a Zcytor5 variant protein. Zcytor5 to a cytokinin-like receptor. Soluble Zcytor5 maintenance factor in the action of a growth and/or maintenance factor in the throid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart to feardiotrophin-l in the centargement. Zcytor5 could be used to detect cardiotrophin-l in the colon, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

The present sequence represents an allelic varaint of Zcytor5, which is a cytokinin-like receptor. Soluble administered to down-regulate the effects of a growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a Zcytor5 variant protein. Zcyto is a cytokinin-like receptor. Soluble Zcytor5 may be administere down-regulate the effects of a growth and/or maintenance factor thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the prese and integrity of the Zcytor5 gene on chromosome 19. Antibodies a anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
                                                   New mammalian cytokinin-like receptor Zcytor5 - useful for, e.g.

      The present sequence represents a Zcytor5 variant protein. Zcytor5 is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNN or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         enlargement. Zcytor5 could be used to detect cardiotrophin-1 on cardiac pathologies, so preventing blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the pres and integrity of the Zcytor5 gene on chromosome 19. Antibodies anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                    (ZYMO) ZYMOGENETICS INC.

                                                                                                       The present sequence represents a Zcytor5 variant protein. Zcytor5 is a Cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome ly. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

CC The present sequence represents a Zcytor5 variant protein. Zcytor5

CC is a cytokinin-like receptor. Soluble Zcytor5 may be administered to

CC down-regulate the effects of a growth and/or maintenance factor in

CC thyroid, heart, and skeletal muscle for example to lessen the effect

CC of cardiotrophin-l on cardiac pathologies, so preventing heart

CC enlargement. Zcytor5 could be used to detect cardiotrophin-l in the

CC blood, and to discover other possible Zcytor5 ligands. A probe

CC comprising Zcytor5 DNA or RNA can be used to determine the presence

and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the

CC anti-lidotypic antibody could be used to purify Zcytor5 and

CC therapeutically to modify Zcytor5 ligand effects.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                    165
